

**Command
Alkon**

Command Alkon is proud to announce new system features and hardware for our TrackIt product offering. Delivery Cycle Monitoring (DCM) functionality enables real-time visibility into each stage in the ready mix delivery cycle including jobsite performance insights.

Drum direction and speed are captured throughout the delivery process with an accurate count of rotations as well as status of the truck at the jobsite. Optional water-add meter sensor captures water added and lets drivers know how much can be added within mix design specifications; historical reporting of water additions also helps protect against false claims from customers.

DCM requires minimal hardware with easy installation. Check out the [Press Release](#) for more on Delivery Cycle Monitoring or learn more about TrackIt now [here](#).
